

JOHN R. KOSINSKI

Senior Systems Architect • Principal Engineer • Operator

john.kosinski@gmail.com

SUMMARY

Senior systems architect and operator specializing in high-stakes data, financial, and distributed systems. Experienced at turning ambiguous business and operational problems into shipped technical solutions across architecture, implementation, infrastructure, and user-facing workflows. Known for owning systems end-to-end where failure carries real financial or operational consequences.

Primary strengths include end-to-end ownership, data-driven systems design, stakeholder-facing execution, and clear technical decision-making in ambiguous environments.

CORE CAPABILITIES

- End-to-end ownership of ambiguous, high-stakes technical problems
 - Data-driven systems design and operational decision support
 - Distributed systems & data pipelines (Kafka, Kubernetes, cloud infra)
 - Customer / stakeholder-facing technical execution
 - Constraint-driven architecture under financial and operational risk
 - LLM-assisted systems combined with deterministic code
 - Financial & risk modeling
 - Automated trading system design and ownership
 - Blockchain, DeFi & smart contract architecture (EVM, Solidity, Rust)
-

SYSTEMS OWNED / SELECTED EXPERIENCE

Stream Finance — Principal Architect

- Translated high-stakes financial product requirements into mission-critical on-chain primitives enabling automated bond rollover and compounding yield under capital-at-risk constraints
 - Delivered system and security architecture for settlement operations driving bond vault workflows
 - Systems secured **hundreds of millions USD in TVL at peak** during initial phase
 - Foundation later enabled a **lucrative stablecoin product locking hundreds of thousands USD in TVL**
 - Operated with only one junior developer; security and correctness were non-negotiable
 - Made irreversible architectural decisions under capital-at-risk constraints
-

QuantGenie — Founder / Principal Architect

- Conceived, validated, and built a natural-language to DSL to compiled trading system that turned trader intent into deterministic execution
 - Owned feasibility analysis, architecture, and proof-of-concept execution from ambiguous product idea to working technical foundation
 - Designed a constrained LLM generation pipeline that combined flexible user input with deterministic compilation and execution
 - Built the backtesting data pipeline needed to turn raw market data into executable strategy evaluation, including normalization, storage, and execution flow
 - Established technical foundations, process flow, and early team structure to support rapid iteration with users
-

Private Client — Principal Architect / Data-Driven Trading Systems

- Building a strategy execution and backtesting platform for prediction-market trading, turning market data, sports event data, and execution diagnostics into strategy decision workflows

- Designed a shared execution model so live trading and historical simulation use the same strategy logic, parameters, diagnostics, and evaluation flow
- Integrated AI analysis over live diagnostics and backtest results to support anomaly detection, operational insight, and strategy iteration
- Implemented Bayesian/Optuna-based parameter optimization over historical market and sports data

Hamza — Founder / System Owner

- Turned an ambiguous multi-chain commerce concept into a production crypto payments platform spanning Ethereum, BNB, Arbitrum, Optimism, Polygon, Bitcoin, Solana, Scroll, and Mantle
 - Delivered the production e-commerce, payments, order-flow, and operational tooling needed to run the platform on AWS
 - Helped define the platform's tokenomics architecture and economic design
 - Owned architecture, execution, and iteration across on-chain systems, web infrastructure, operations, and customer discovery
 - Platform handled hundreds of users per month and ~\$5–10k USD monthly throughput
-

Skunk Capital — System Owner

- Converted previously manual cash-and-carry arbitrage into automated trading workflows operating with real capital
 - Designed trading infrastructure for durable, long-lived operation under real-capital constraints
 - System operated with hundreds of thousands USD in deployed capital
-

Alteryx — Senior Engineer

- Delivered fixes inside a large, unfamiliar C++ analytics platform supporting complex data workflows
- Rapidly oriented within a mature, undocumented codebase
- Used production defects to identify non-obvious failure modes across unfamiliar subsystems
- Delivered tested fixes across multiple subsystems while operating under production constraints

ADDITIONAL EXPERIENCE

- Morgan Stanley
- Aquamonix
- Leeds Rising
- Manao Software
- HotelTravel

(Details intentionally compressed; full history available on request)

OPERATING PRINCIPLES

- Own the outcome, not just the implementation
 - Design for failure modes before success cases
 - Prefer irreversible correctness over reversible speed when capital is at risk
 - Direct and clear communication
-

TOOLS & TECHNOLOGIES (SELECTED)

- Solidity
- Rust
- Echidna
- TypeScript
- Smart Contract Security
- Python
- C++
- AWS, GCP
- Kubernetes
- Kafka
- PostgreSQL
- DeFi Protocol Design
- Trading Infrastructure

- LLM Integration
 - Data Pipelines
 - Full-Stack Systems
 - Cloud Infrastructure
-

AVAILABILITY

Senior / Principal-level roles requiring end-to-end ownership of high-stakes technical systems, ambiguous problem-solving, stakeholder interaction, and correctness under real operational risk.
