

JOHN R. KOSINSKI

Senior Systems Architect • Principal Engineer • Operator

SUMMARY

Senior technologist and system owner specializing in **high-risk, high-constraint environments** across blockchain, financial markets, and large-scale distributed systems. Known for **owning systems end-to-end** where failure carries real financial, operational, or reputational consequences. Brings ideas from concept to production under uncertainty, minimal resources, and tight constraints.

Primary strengths include system ownership under risk, constraint-driven architecture, and decision ownership in ambiguous environments.

CORE CAPABILITIES

- System ownership under financial and operational risk
 - Constraint-driven architecture (security, capital, latency, irreversibility)
 - Blockchain & DeFi system design (EVM, cross-chain, tokenomics)
 - Smart contract architecture & testing (Solidity, Rust)
 - Distributed systems & data pipelines (Kafka, Kubernetes, cloud infra)
 - Financial & risk modeling
 - Automated trading system design and ownership
 - LLM-assisted systems combined with deterministic code
 - Clear technical decision-making under uncertainty
-

SYSTEMS OWNED / SELECTED EXPERIENCE

Stream Finance — Principal Architect

- Designed and implemented **mission-critical on-chain financial primitives** supporting bond rollover and compounding yield
 - **Implemented system and security architecture for the back-office settlement system** driving bond vault operations
 - Systems secured **hundreds of millions USD in TVL at peak** during initial phase
 - Foundation later enabled a **lucrative stablecoin product locking hundreds of thousands USD in TVL**
 - Operated with only one junior developer; security and correctness were non-negotiable
 - Made irreversible architectural decisions under capital-at-risk constraints
-

QuantGenie — Founder / Principal Architect

- Conceived, validated, and built a **natural-language → DSL → compiled trading system** targeting retail traders
 - Sole technical owner responsible for feasibility analysis, system architecture, and proof-of-concept execution
 - Designed a constrained LLM generation pipeline integrated with deterministic compilation and execution
 - **Architected the backtesting data ingestion and processing pipeline**, including data normalization, storage, and execution flow
 - Established technical foundations, process flow, and early team structure
-

Hamza — Founder / System Owner

- Conceived, architected, specified, and implemented (with small teams) a **multi-chain crypto payments platform** spanning Ethereum, BNB, Arbitrum, Optimism, Polygon, Bitcoin, Solana, Scroll, and Mantle
 - Built a **full-stack e-commerce platform on AWS** (MedusaJS-based), including payments, order flow, and operational tooling
 - Instrumental in the **design of the platform's tokenomics architecture**
 - Owned architecture, execution, and iteration across on-chain systems, web infrastructure, and economic design while simultaneously discovering customer requirements
 - Platform handled hundreds of users per month and ~\$5–10k USD monthly throughput
-

Skunk Capital — System Owner

- Automated previously manual **cash-and-carry arbitrage strategies** with real capital
 - Designed trading infrastructure for durability and longevity
 - System operated with hundreds of thousands USD in deployed capital
-

Alteryx — Senior Engineer

- Worked within a large, unfamiliar C++ framework supporting complex data and analytics workloads
 - Rapidly oriented within a mature, undocumented codebase
 - Diagnosed and resolved defects appearing in new and non-obvious areas of the system
 - Implemented and tested fixes across multiple subsystems under production constraints
-

ADDITIONAL EXPERIENCE

- Morgan Stanley
- Aquamonix
- Leeds Rising
- Manao Software
- HotelTravel

(Details intentionally compressed; full history available on request)

OPERATING PRINCIPLES

- Own the outcome, not just the implementation
 - Design for failure modes before success cases
 - Prefer irreversible correctness over reversible speed when capital is at risk
 - Direct and clear communication
-

TOOLS & TECHNOLOGIES (SELECTED)

- Solidity
 - Rust
 - TypeScript
 - Python
 - C++
 - AWS, GCP
 - Kubernetes
 - Kafka,
 - PostgreSQL
 - Smart Contract Security
 - DeFi Protocol Design
 - Trading Infrastructure
 - LLM Integration
-

AVAILABILITY

Senior / Principal-level roles where **early ownership**, **architecture under risk**, and **decision authority** are required.
